

Florida Energy Google Charts Info

The two charts included are showcased on the /energy.html page of the website, with files script.js and script2.js corresponding to Renewable Production and Renewable Consumption graphs. Google line graph was used as I thought it was the best type of graph to display large amounts of data that spans over many years.

Filters were added to narrow down the graphs x-axis as I thought it would be helpful for users to be able to compare and contrast different and more specific periods of times to get a better understanding of trends and dips of production and consumption.

Data Source:

The information used for these graphs were pulled from the U.S Energy Information Administration website.

[Production](#)

[Consumption](#)
